17.12.84 as 019586 (349DB)

The floating board (1) on which one person stands, using body movements to cause the board to travel on water, has two fins (3,4) resembling the tail of a fish attached to the rear. The underside of the board is stepped at the rear, forming a recess and a locating shoulder for the fins, which are bolted in position.

Near the front of the board is a cable loop (8) held by the user in a standing position, and assisting steering and also enabling the user to produce a rocking motion for driving the board forward. A small keel projects downwards at the front.

ADVANTAGE - Simple design, no power unit being required. (7pp
